## Supplementary Note

### Calculation of turnover frequency (TOF)

$$\text{TOF} = \frac{\text{number of produced molecules}}{\text{number of active sites} * \text{total reaction time}} \quad (\text{Supplementary Equation 1})$$

$$N_A = 6.022 \times 10^{17} \mu\text{mol}^{-1}$$

$$\text{Number of produced molecules per hour} = \frac{\text{CO rate} * N_A}{\text{total reaction time}} \quad (\text{Supplementary Equation 2})$$

Total reaction time = 1 h

$$\text{Number of surface O atoms at exposed facet} = 9.23 \times 10^{18} \text{ m}^{-2}$$

✧ Pristine  $\text{In}_2\text{O}_3$  rate:  $35.6 \mu\text{mol h}^{-1}\text{g}^{-1} \rightarrow 1.06 \mu\text{mol h}^{-1}\text{m}^{-2}$  (according to the surface area:  $33.5 \text{ m}^2\text{g}^{-1}$ )

The number of produced molecules per hour for pristine  $\text{In}_2\text{O}_3$  is  $6.38 \times 10^{17} \text{ m}^{-2}\text{h}^{-1}$

✧ 1.0%  $\text{Bi}_x\text{In}_{2-x}\text{O}_3$  rate:  $7959 \mu\text{mol h}^{-1}\text{g}^{-1} \rightarrow 232.72 \mu\text{mol h}^{-1}\text{m}^{-2}$  (according to the surface area:  $34.2 \text{ m}^2\text{g}^{-1}$ )

The number of produced molecules per hour for 1.0%  $\text{Bi}_x\text{In}_{2-x}\text{O}_3$  is  $1.4 \times 10^{20} \text{ m}^{-2}\text{h}^{-1}$

### Model 1: Assume all [O] will be used for reaction

$$\text{Number of active sites} = \text{number of [O]} = 9.23 \times 10^{18} \text{ m}^{-2} \times [\text{O}] \text{ value obtained from XPS (41.34\%)} = 3.82 \times 10^{18} \text{ m}^{-2}$$

$$\text{TOF}_{\text{In}_2\text{O}_3} = 6.38 \times 10^{17} \text{ m}^{-2}\text{h}^{-1} / 3.82 \times 10^{18} \text{ m}^{-2} = 0.167 \text{ h}^{-1}$$

$$\text{Similarly, TOF}_{1.0\% \text{ Bi}_x\text{In}_{2-x}\text{O}_3} = 36.8 \text{ h}^{-1}.$$

### Model 2: Assume only extrinsic [O] will be used for reaction

$$\text{Number of active sites} = \text{number of extrinsic [O]} = 9.23 \times 10^{18} \text{ m}^{-2} \times ([\text{O}] \text{ value obtained from XPS (41.34\%)} - \text{intrinsic [O] of } \text{In}_2\text{O}_3 \text{ (25\%)}) = 1.51 \times 10^{18} \text{ m}^{-2}$$

$$\text{TOF}_{\text{In}_2\text{O}_3} = 6.38 \times 10^{17} \text{ m}^{-2}\text{h}^{-1} / 1.51 \times 10^{18} \text{ m}^{-2} = 0.42 \text{ h}^{-1}$$

$$\text{As a result, TOF}_{1.0\% \text{ Bi}_x\text{In}_{2-x}\text{O}_3} = 93.6 \text{ h}^{-1}.$$
